yogi.ai Setup Guide

Everything you need, how to get it, and what it costs

How it works (in one line)

You miss a call on your Airtel number > Airtel forwards it to your **Vobiz** number > Vobiz streams the audio to your **Oracle Cloud** server > **Gemini** AI talks to the caller > the transcript and summary are saved in **Supabase** > you read them on your phone dashboard.

Is it free?

Almost everything is free. Only the phone line (Vobiz) costs money.

Piece	Cost	Notes
Gemini AI (voice + summaries)	FREE	Free tier. Google may use free-tier data to improve its products.
Supabase database	FREE	500 MB. Pauses after ~1 week of no use (the app keeps it awake).
Oracle Cloud server (Mumbai)	FREE	Always Free. A card is needed for verification only.
DuckDNS domain + HTTPS	FREE	Free subdomain like yogi-assistant.duckdns.org
Practice mode on laptop	FREE	Talk to the AI with your mic to test before paying for anything.
Vobiz number + minutes	**PAID**	Monthly number rent (setup fee = 1 month) + per-minute call and streaming charges. Check the INR prices in the Vobiz console.
Airtel call forwarding	Usually free	Billed like an outgoing call. Normally covered by unlimited plans.

What I need from you

#	Item	Where you get it	Cost	Needed for
1	GEMINI_API_KEY	aistudio.google.com/apikey	Free	Practice + real calls
2	DATABASE_URL	supabase.com	Free	Practice + real calls
3	Oracle VM public IP + SSH key file	oracle.com/cloud/free	Free	Real calls
4	DuckDNS subdomain	duckdns.org	Free	Real calls
5	Vobiz Auth ID, Auth Token, number	vobiz.ai	PAID	Real calls
6	Dashboard password (you choose, 10+ chars)	Make one up	Free	Real calls

Order: do items 1 and 2 first (10 minutes, free) and I will get practice mode running on your laptop. Do 3 to 6 only after practice mode works.

Step 1 - Gemini API key (free, 2 minutes)

1. Open **aistudio.google.com/apikey** and sign in with your Google account.
2. Click **Create API key**. If it asks for a project, pick **Create new project**.
3. Copy the key (it starts with `AIza...`). This is your **GEMINI_API_KEY**.

Step 2 - Supabase database (free, 5 minutes)

1. Open **supabase.com** and sign up (Sign in with GitHub or Google is easiest).
2. Click **New project**. Name: `yogi-ai`. Set a **database password** and **save it somewhere**. Region: **South Asia (Mumbai)**. Click Create.
3. Wait 1-2 minutes for the project to start.
4. Click the **Connect** button at the top > choose **Session pooler** > copy the URI. It looks like:

```
postgresql://postgres.abcdxyz:[YOUR-PASSWORD]@aws-0-ap-south-1.pooler.supabase.com:5432/postgres
```

1. Replace `[YOUR-PASSWORD]` with your database password. This is your **DATABASE_URL**.

Password tip: if your password has `@ # ? / :` or spaces, the link breaks. Easiest fix: in Supabase, reset the database password to letters and numbers only.

Step 3 - Put them in the .env file

1. Open `C:\Users\FS165\yogi.ai\.env` in Notepad.
2. Fill these lines (no spaces, no quotes):

```
GEMINI_API_KEY=AIza...your key...
DATABASE_URL=postgresql://postgres.abcdxyz:yourpassword@aws-0-ap-south-1.pooler.supabase.com:5432/postgres
OWNER_NAME=Yogesh
OWNER_PHONE=+91XXXXXXXXXX
```

1. Save the file and tell me **"done"**. I will run the check and start practice mode.

Step 4 - Practice call (free)

I set this up and run it for you. You put on **headphones**, open the dashboard (`http://127.0.0.1:8765`), go to **Live > Start practice call**, and talk to the AI like a caller would. After you hang up, a summary appears in **History**. If you like how it works, move on to the real phone setup on the next pages.

Step 5 - Oracle Cloud free server (free, 20-30 minutes)

1. Open **oracle.com/cloud/free** > **Start for free**. Use your real name and address.
2. **Home region: choose "India West (Mumbai)".** You can't change it later.
3. Add a debit or credit card. It's for verification only (you may see a small temporary hold). Always Free resources are never charged.
4. After login: Menu > **Compute > Instances > Create instance**.
5. Image: click **Change image** > **Canonical Ubuntu 24.04**.
6. Shape: **Change shape > Ampere > VM.Standard.A1.Flex**, 1 OCPU, 6 GB RAM. If it says *out of capacity*, use **VM.Standard.E2.1.Micro** instead (also free).
7. SSH keys: choose **Generate a key pair** > click **Download private key**. Save it as `C:\Users\FS165\.ssh\oracle.key`.
8. Click **Create**. Wait until it shows **RUNNING**, then copy the **Public IP address**.
9. Open the ports: on the instance page click the **Subnet** link > **Security Lists** > Default Security List > **Add Ingress Rules**. Source CIDR `0.0.0.0/0`, protocol TCP, destination port `80,443`. Save.

Send me: the Public IP (e.g. 140.245.x.x) and confirm the key file is saved at C:\Users\FS165\.ssh\oracle.key. **Never send me the key file's contents.**

Step 6 - Free domain: DuckDNS (free, 3 minutes)

1. Open **duckdns.org** and sign in with Google or GitHub.
2. Type a subdomain name, e.g. `yogi-assistant` > **add domain**.
3. In the **current ip** box, paste your Oracle Public IP > **update ip**.

Send me: the full domain, e.g. yogi-assistant.duckdns.org

Step 7 - Dashboard password

Pick a password with at least 10 characters. You'll use it to log in to the dashboard from your phone. You can type it into .env.server yourself, or I can generate a strong one for you.

Step 8 - Vobiz phone number (PAID, 15 minutes)

1. Open **vobiz.ai** > sign up > Console.
2. **KYC > Individual**: upload Aadhaar or PAN. It's usually approved within minutes.
3. **Check the prices first** (number rent per month, per-minute inbound/outbound, streaming). Then add a small balance.
4. **Buy an Indian number.** Write it down in +91 format.
5. Console > **API credentials**: copy the **Auth ID** and **Auth Token**.
6. Don't create the Voice Application yet. I'll give you the exact Answer and Hangup URLs after deploying (they also appear in Dashboard > Settings > Phone line).

Send me: the Vobiz number. Put the Auth ID and Auth Token in .env.server yourself, or send them to me and change the token later if you want.

Step 9 - I deploy it

When I have the IP, key file, domain, password and Vobiz details, I fill .env.server and run the deploy script. Then you open `https://yogi-assistant.duckdns.org` on your phone and log in.

Step 10 - Turn on Airtel call forwarding (on your Android)

Open the Phone app and dial these codes, putting your Vobiz number in place of **NUMBER**:

When	Turn ON (dial)	Turn OFF
You don't answer (rings ~20 s)	**61*NUMBER**20#	##61#
You are busy on another call	**67*NUMBER#	##67#
Phone off / no signal	**62*NUMBER#	##62#
Switch everything off	-	##002#

Do NOT turn on "Always forward", or your phone will never ring. To check status, dial `*#61#`.

Step 11 - Test

Call your mobile from another phone and don't pick up. After about 20 seconds the AI answers, the call shows live in the dashboard, and the summary appears in History a minute after you hang up.

Quick checklist

Done?	Item
[ ]	Gemini API key in .env
[ ]	Supabase DATABASE_URL in .env
[ ]	Practice call works on laptop
[ ]	Oracle VM running, IP noted, oracle.key saved, ports 80/443 open
[ ]	DuckDNS domain pointing to the VM IP
[ ]	Vobiz KYC done, number bought, Auth ID + Token copied
[ ]	Deployed, dashboard opens on phone
[ ]	Airtel forwarding codes dialled, test call answered by the AI
